

MVP Goal

A user should be able to:

1. Upload product information.
2. Upload product images.
3. Select social platforms.
4. Click "Generate Campaign".
5. Receive ready-to-post content and creatives.
6. Publish or schedule posts.

If this works reliably, you already have a sellable product.

MVP Architecture

Module 1: Product Knowledge Input

User enters:

- Product name
- Description
- Features
- Target audience
- Industry

Uploads:

- Product images
- Logo

Store in database.

Example

Product:
AI Resume Builder

Audience:
Students and Job Seekers

Features:
ATS optimized resumes
One-click generation
AI recommendations

Module 2: Content Generation Agent

Use Claude/GPT.

Generate:

Instagram

- Caption
- Hashtags

Facebook

- Post content

LinkedIn

- Professional post

Example:

Instagram Caption:

Land your dream job faster 🚀

Create ATS-friendly resumes using AI and increase your interview chances.

#ResumeBuilder #AIJobs #CareerGrowth

This alone creates immediate value.

Module 3: Creative Generation

Use:

- GPT Image
- Flux
- Stability AI

Input:

Generate an Instagram advertisement for AI Resume Builder.

Use blue and white theme.

Show a modern resume dashboard.

Target college students.

Or use uploaded product images.

Output:

- Instagram post

- Story
- LinkedIn banner

Module 4: Campaign Generator

Bundle generated content.

Output:

Campaign 1

Instagram:
Caption + Creative

Facebook:
Post + Creative

LinkedIn:
Post + Banner

Module 5: Social Media Publishing

Most important MVP feature.

Integrate:

Meta Graph API

Supports:

- Facebook Pages
- Instagram Business Accounts

Publish directly.

Workflow:

```
Generate Content
  ↓
Review
  ↓
Approve
  ↓
Publish to Instagram/Facebook
```

This is already a strong SaaS feature.

Optional MVP+

If you have another week:

Content Calendar

Generate:

30 Day Marketing Plan

Example:

Day	Topic
1	Product Intro
2	Customer Pain Point
3	Feature Highlight
4	Testimonial

Then auto-generate all posts.

Very attractive to customers.

What NOT To Build Yet

Avoid:

- ✗ Customer identification
- ✗ Automated DM outreach
- ✗ Competitor intelligence
- ✗ Lead scoring
- ✗ Ad budget optimization
- ✗ Multi-agent frameworks
- ✗ Complex analytics
- ✗ Recommendation engines

These consume 80% of development time and add little value to an initial demo.

Recommended Tech Stack

Frontend:

- Next.js
- Tailwind
- Vercel

Backend:

- FastAPI

Database:

- Supabase

AI:

- Claude API (content generation)
- GPT Image / Flux (creative generation)

Storage:

- Supabase Storage

Social Publishing:

- Meta Graph API
-

2-Week MVP Plan

Week 1

- Authentication
- Product upload
- Image upload
- Claude integration
- Generate captions

Week 2

- Creative generation
- Meta API integration
- Campaign dashboard

- Publish button

At the end of 2 weeks, you'll have:

"Upload product → Generate marketing campaign → Publish to Instagram/Facebook"

That's a focused MVP that is demonstrable to clients, investors, and potential users, and it lays the foundation for all the more advanced agentic marketing capabilities later.
